

Access Management Toolkit

1. Locate signals to favor through movement.

Long, uniform spacing of signals on major roadways enhances the ability to coordinate signals; result: stop delays are minimized, continuous movement at desired speed is ensured.

2. Limit conflict points / separate conflict areas.

3. Remove left-turns from through-traffic lanes.

- Provide left-turn lanes.
- Provide adequate turn lane lengths for storage of vehicles waiting to turn.

4. Use nontraversable medians to manage left-turn movements.

5. Manage left-turn movements.

6. Provide supporting street and circulation system.

- Local streets connected to “collector” streets (with access to major roadways).
- Frontage roadways connected to “collector” streets.
